#### Bioinformation

Gene Symbol NDUFB7

Gene Full Name NADH: Ubiquinone Oxidoreductase Subunit B7

Background The protein encoded by this gene is a subunit of the multisubunit NADH:ubiquinone oxidoreductase

(complex I). Mammalian complex I is composed of 45 different subunits. It is located at the mitochondrial inner membrane. This protein has NADH dehydrogenase activity and oxidoreductase activity. It transfers electrons from NADH to the respiratory chain. The immediate electron acceptor for

the enzyme is believed to be ubiquinone.

Function Accessory subunit of the mitochondrial membrane respiratory chain NADH dehydrogenase (Complex I),

that is believed not to be involved in catalysis. Complex I functions in the transfer of electrons from NADH to the respiratory chain. The immediate electron acceptor for the enzyme is believed to be

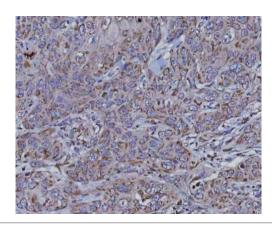

ubiquinone.

Calculated Mw 16 kDa

PTM Disulfide bond, Lipoprotein, Myristate, Phosphoprotein

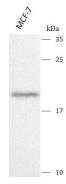

Cellular Localization Membrane, Mitochondrion, Mitochondrion inner membrane
