## Bioinformation

---

Gene Symbol	LPCAT2
Gene Full Name	Lysophosphatidylcholine Acyltransferase 2
Background	This gene encodes a member of the lysophospholipid acyltransferase family. The encoded enzyme may function in two ways: to catalyze the biosynthesis of platelet-activating factor (1-O-alkyl-2-acetyl-sn-glycero-3-phosphocholine) from 1-O-alkyl-sn-glycero-3-phosphocholine, and to catalyze the synthesis of glycerophospholipid precursors from arachidonyl-CoA and lysophosphatidylcholine. The encoded protein may function in membrane biogenesis and production of platelet-activating factor in inflammatory cells. The enzyme may localize to the endoplasmic reticulum and the Golgi.
Function	Exhibits both acyltransferase and acetyltransferase activities.
Calculated Mw	60 kDa
Cellular Localization	Cell membrane, Endoplasmic reticulum, Golgi apparatus, Lipid droplet, Membrane
