Bioinformation

Database links	GeneID: 10457 Human Swiss-port # Q14956 Human
Gene Symbol	GPNMB
Gene Full Name	glycoprotein (transmembrane) nmb
Background	The protein encoded by this gene is a type I transmembrane glycoprotein which shows homology to the pMEL17 precursor, a melanocyte-specific protein. GPNMB shows expression in the lowly metastatic human melanoma cell lines and xenografts but does not show expression in the highly metastatic cell lines. GPNMB may be involved in growth delay and reduction of metastatic potential. Two transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Jul 2008]
Function	Could be a melanogenic enzyme. [UniProt]
Calculated Mw	64 kDa
