Summary

Product Description	<p>Autophagy consists of a destructive mechanism that disassemble unnecessary or dysfunctional cellular components through a regulated process. Targeted cellular constituents are enclosed by double-membraned vesicle called autophagosome. LC3s (MAP1-LC3A, B and C) are structural proteins of autophagosomal membranes, widely used as biomarkers of autophagy. They are processed from their precursors and bound to PE to form autophagosome before being fused to lysosome and breakdown the enclosed components. In the cytoplasm, there was a minimal co-localization between LC3A and B staining, suggesting that the relevant autophagosomes are formed by only one out of the two LC3 proteins.</p> <p>Koukourakis M. et al. 2015.
