### Summary

Product Description	<p>Polycomb-group (PcG) genes encode chromatin proteins involved in stable and heritable transcriptional silencing. PcG proteins participate in distinct multimeric complexes that deposit, or bind to, specific histone modifications (e.g., H3K27me3) to prevent gene activation and maintain repressed chromatin domains. Ezh2, Ring1A and Ring1B are core components of the mammalian Polycomb system, which regulates cell differentiation during embryonic development and tissue maintenance during adult life.</p> <p>Grossniklaus and Paro.
