Bioinformation

Gene Symbol	ATP5G1; ATP5G2; ATP5G3
Gene Full Name	ATP synthase, H ⁺ transporting, mitochondrial Fo complex, subunit C1 (subunit 9) ATP synthase, H ⁺ transporting, mitochondrial Fo complex, subunit C2 (subunit 9) ATP synthase, H ⁺ transporting, mitochondrial Fo complex, subunit C3 (subunit 9)
Background	This gene encodes a subunit of mitochondrial ATP synthase. Mitochondrial ATP synthase catalyzes ATP synthesis, utilizing an electrochemical gradient of protons across the inner membrane during oxidative phosphorylation. ATP synthase is composed of two linked multi-subunit complexes: the soluble catalytic core, F1, and the membrane-spanning component, Fo, comprising the proton channel. The catalytic portion of mitochondrial ATP synthase consists of 5 different subunits (alpha, beta, gamma, delta, and epsilon) assembled with a stoichiometry of 3 alpha, 3 beta, and a single representative of the other 3. The proton channel seems to have nine subunits (a, b, c, d, e, f, g, F6 and 8). This gene is one of three genes that encode subunit c of the proton channel. Each of the three genes have distinct mitochondrial import sequences but encode the identical mature protein. Alternatively spliced transcript variants encoding the same protein have been identified. [provided by RefSeq, Jul 2008]
Function	Mitochondrial membrane ATP synthase (F(1)F(0) ATP synthase or Complex V) produces ATP from ADP in the presence of a proton gradient across the membrane which is generated by electron transport complexes of the respiratory chain. F-type ATPases consist of two structural domains, F(1) - containing the extramembraneous catalytic core and F(0) - containing the membrane proton channel, linked together by a central stalk and a peripheral stalk. During catalysis, ATP synthesis in the catalytic domain of F(1) is coupled via a rotary mechanism of the central stalk subunits to proton translocation. Part of the complex F(0) domain. A homomeric c-ring of probably 10 subunits is part of the complex rotary element. [UniProt]
Calculated Mw	ATP5G1: 14 kDa ATP5G2: 15 kDa ATP5G3: 15 kDa
Cellular Localization	ATP5G1/G2/G3: Mitochondrion membrane; Multi-pass membrane protein. [UniProt]
