### **Bioinformation**

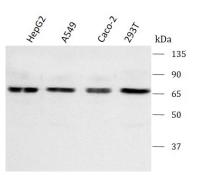

| Gene Symbol           | NR5A2  |
|-----------------------|--|
| Gene Full Name        | Nuclear Receptor Subfamily 5 Group A Member 2  |
| Background            | The protein encoded by this gene is a DNA-binding zinc finger transcription factor and is a member of the fushi tarazu factor-1 subfamily of orphan nuclear receptors. The encoded protein is involved in the expression of genes for hepatitis B virus and cholesterol biosynthesis, and may be an important regulator of embryonic development.  |
| Function              | Nuclear receptor that acts as a key metabolic sensor by regulating the expression of genes involved in bile acid synthesis, cholesterol homeostasis and triglyceride synthesis. Together with the oxysterol receptors NR1H3/LXR-alpha and NR1H2/LXR-beta, acts as an essential transcriptional regulator of lipid metabolism. Plays an anti-inflammatory role during the hepatic acute phase response by acting as a corepressor: inhibits the hepatic acute phase response by preventing dissociation of the N-Cor corepressor complex. |
| Calculated Mw         | 61 kDa   |
| PTM                   | Isopeptide bond, Ubl conjugation   |
| Cellular Localization | Nucleus  |
|                       |  |
