Bioinformation

Gene Symbol	CBLIF
Gene Full Name	cobalamin binding intrinsic factor
Background	This gene is a member of the cobalamin transport protein family. It encodes a glycoprotein secreted by parietal cells of the gastric mucosa and is required for adequate absorption of vitamin B12. Vitamin B12 is necessary for erythrocyte maturation and mutations in this gene may lead to congenital pernicious anemia. [provided by RefSeq, Jul 2008]
Function	Promotes absorption of the essential vitamin cobalamin (Cbl) in the ileum. After interaction with CUBN, the GIF-cobalamin complex is internalized via receptor-mediated endocytosis. [UniProt]
Calculated Mw	45 kDa
Cellular Localization	Extracellular region or secreted. [UniProt]
