

ARG66207 anti-Androgen Receptor antibody [SQab1729]

Package: 100 µl, 50 µl
Store at: -20°C

Summary

Product Description	Recombinant Rabbit Monoclonal antibody [SQab1729] recognizes Androgen Receptor
Tested Reactivity	Hu, Ms, Rat
Tested Application	IHC-P, WB
Host	Rabbit
Clonality	Monoclonal
Clone	SQab1729
Isotype	IgG
Target Name	Androgen Receptor
Species	Human
Immunogen	Synthetic peptide around the N-terminus of Androgen Receptor.
Conjugation	Un-conjugated
Alternate Names	TFM; Dihydrotestosterone receptor; Androgen receptor; KD; AR8; HUMARA; NR3C4; AIS; SBMA; HYSY1; SMAX1; Nuclear receptor subfamily 3 group C member 4; DHTR

Application Instructions

Application table	Application	Dilution
	IHC-P	1:100 - 1:200
	WB	1:2000 - 1:5000
Application Note	IHC-P: Antigen retrieval: Heat mediated was performed using Tris/EDTA buffer pH 9.0 * The dilutions indicate recommended starting dilutions and the optimal dilutions or concentrations should be determined by the scientist.	
Observed Size	100 kDa	

Properties

Form	Liquid
Purification	Affinity purification with immunogen.
Buffer	PBS, 0.01% Sodium azide, 40% Glycerol and 0.05% BSA.
Preservative	0.01% Sodium azide
Stabilizer	40% Glycerol and 0.05% BSA
Storage instruction	For continuous use, store undiluted antibody at 2-8°C for up to a week. For long-term storage, aliquot and store at -20°C. Storage in frost free freezers is not recommended. Avoid repeated freeze/thaw cycles. Suggest spin the vial prior to opening. The antibody solution should be gently mixed before use.

Note For laboratory research only, not for drug, diagnostic or other use.

Bioinformation

Gene Symbol	AR
Gene Full Name	androgen receptor
Background	<p>Androgen Receptor is a protein that has 3 major functional domains: the N-terminal domain, DNA-binding domain, and androgen-binding domain. The protein functions as a steroid-hormone activated transcription factor. Upon binding the hormone ligand, the receptor dissociates from accessory proteins, translocates into the nucleus, dimerizes, and then stimulates transcription of androgen responsive genes. This gene contains 2 polymorphic trinucleotide repeat segments that encode polyglutamine and polyglycine tracts in the N-terminal transactivation domain of its protein. Expansion of the polyglutamine tract from the normal 9-34 repeats to the pathogenic 38-62 repeats causes spinal bulbar muscular atrophy (SBMA, also known as Kennedy's disease). Mutations in this gene are also associated with complete androgen insensitivity (CAIS). Alternative splicing results in multiple transcript variants encoding different isoforms. [provided by RefSeq, Jan 2017]</p>
Function	<p>Androgen Receptors are ligand-activated transcription factors that regulate eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues. Transcription factor activity is modulated by bound coactivator and corepressor proteins like ZBTB7A that recruits NCOR1 and NCOR2 to the androgen response elements/ARE on target genes, negatively regulating androgen receptor signaling and androgen-induced cell proliferation (PubMed:20812024). Transcription activation is also down-regulated by NROB2. Activated, but not phosphorylated, by HIPK3 and ZIPK/DAPK3.</p> <p>Isoform 3 and isoform 4 lack the C-terminal ligand-binding domain and may therefore constitutively activate the transcription of a specific set of genes independently of steroid hormones. [UniProt]</p>
Highlight	<p>Related products: Androgen Receptor antibodies;</p> <p>Related news: Cancer Pathology Markers (SQ clones)</p>
Calculated Mw	99 kDa
PTM	<p>Sumoylated on Lys-388 (major) and Lys-521. Ubiquitinated. Deubiquitinated by USP26. 'Lys-6' and 'Lys-27'-linked polyubiquitination by RNF6 modulates AR transcriptional activity and specificity. Phosphorylated in prostate cancer cells in response to several growth factors including EGF. Phosphorylation is induced by c-Src kinase (CSK). Tyr-535 is one of the major phosphorylation sites and an increase in phosphorylation and Src kinase activity is associated with prostate cancer progression. Phosphorylation by TNK2 enhances the DNA-binding and transcriptional activity and may be responsible for androgen-independent progression of prostate cancer. Phosphorylation at Ser-83 by CDK9 regulates AR promoter selectivity and cell growth. Phosphorylation by PAK6 leads to AR-mediated transcription inhibition.</p> <p>Palmitoylated by ZDHHC7 and ZDHHC21. Palmitoylation is required for plasma membrane targeting and for rapid intracellular signaling via ERK and AKT kinases and cAMP generation.</p>

ARG66207 anti-Androgen Receptor antibody [SQab1729] IHC-P image

Immunohistochemistry: Formalin-fixed and paraffin-embedded Human prostate tissue stained with ARG66207 anti-Androgen Receptor antibody [SQab1729] at 1:200 dilution.

Antigen retrieval: Heat mediated was performed using Tris/EDTA buffer pH 9.0

ARG66207 anti-Androgen Receptor antibody [SQab1729] WB image

Western blot: 10 µg of T47D and A549 cell lysates stained with ARG66207 anti-Androgen Receptor antibody [SQab1729] at 1:2000 dilution.

ARG66207 anti-Androgen Receptor antibody [SQab1729] WB image

Western blot: 10 µg of Rat testis and Mouse testis lysates stained with ARG66207 anti-Androgen Receptor antibody [SQab1729] at 1:5000 dilution.
