Bioinformation

Gene Symbol	FCGRT
Gene Full Name	Fc fragment of IgG, receptor, transporter, alpha
Background	This gene encodes a receptor that binds the Fc region of monomeric immunoglobulin G. The encoded protein transfers immunoglobulin G antibodies from mother to fetus across the placenta. This protein also binds immunoglobulin G to protect the antibody from degradation. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Apr 2009]
Function	Binds to the Fc region of monomeric immunoglobulins gamma. Mediates the uptake of IgG from milk. Possible role in transfer of immunoglobulin G from mother to fetus. [UniProt]

Cellular Localization	Cell membrane; Single-pass type I membrane protein. [UniProt]
